To learn how to pair your DualSense controller with other devices, visit PlayStation.com/support/hardware/pair-dualsense-controller-luetooth. You've been playing games on PlayStation 4 devices older than Android for a long time, but Sony recently released its own Remote Play app for iOS. Here's how to keep it all organized and what she likes to use. What is PS4 Distance Reading? As the name suggests, PS4 Remote Casting is a way to remotely stream games directly from your PlayStation 4 to another device. It's been available on Windows, Mac, and Android for a while now, but it was brought to iOS last week. If you're trying to get this solution on another device, you can check out our Windows and Mac or Android configuration guides here. Otherwise, see how to set it up on iOS and some thoughts on how it works, especially compared to other devices. How to set up remote reading on your iPhoneFirst you have to install the PS4 Remote Play app on your IDEVICE on your iPad. It is compatible with iPhone and iPad. You also have to make sure that your IDEVICE and your PS4 are in the same Wi-Fi network. Take your PlayStation 4 after installation and make sure that the remote playback is activated. Go to the menu symbol Settings that look like a small suitcase. From there, scroll down to the menu repro settings and click on it. The best option is to activate remote playback, make sure it is activated. Do not leave this menu yet because you need it in the following steps. But now they go to your IDEVICE and start the PS4 Remote Play app. At the start it shows a simple screen with a large old start button. Tap on it and then access your Sony account. The app begins immediately with the search for your Playstation. In my experience it was unstable and sometimes I find it instantly. In other cases it takes ages (or not at all). To just keep things, go to your PS4 and click on the "Add device" menu (always in the settings for the reproductive remote connection). The code is displayed. Return to IDEVICE, tap the manual registration button and enter the code displayed on PS4. Everything is there. It should come together and you will be ready to rock and roll. After that you just have to do it once and you should be able to start remote playback anywhere, even if you are away from home again. Go to the remote reproduction option as soon as everything is done. You can take a short second to make sure you get the best possible experience. Tap the gear symbol in the upper right corner on the main screen of the remote playback (before connecting to the PS4). The main thing that you should focus on is the visual quality of the remote playback option, which determines how beautiful your game is or how bad it does, the remote play resolution is set to standard (540p) is probably okay on an iPhone screen, but seems rather pixelated on an iPad. The fact is that it creates a good flow and everything that increases the risk of affecting experience. It is also worth noting that the 1080p option is only available for the PS4 Pro. Normal PS4 is more limited to 720p. After the resolution, you can also correct the image rate here. It also looks better here, but can also cause performance problems. in case of aThe frame frame comes across a bottleneck that is caused by the internet speed. The resulting game is blurred and delayed, which leads to a lower frame frequency. Sometimes it is better to set the gatometers to default settings (standard) settings. Otherwise, this is an offer in which you can park the Sony account or change PS4 remote with which you can connect. The use of the remote rendering in the ID: Fuj, Remote reproduction on Android, Windows or Mac offers a great advantage: thanks to these devices, you can use PS4 DualShock 4. This is not possible for iOS long before the publication of a remote game for IDEVICE. The solution here (the same end of Sony) offers the iOS contact control. Now I want to talk about it because it is an essential part of a distant iOS game. Control over the touch of action games is usually quite terrible, especially when these games were designed for the control of the game. You may not be surprised, but the long -distance play on iOS is no different. Playing games like God of War or Red Dead Redemption 2 is an absolutely terrible, almost unattractive experience to play a distance. If you have to press the combination of buttons for (or not at all) to make the right movement, the touch control simply does not suffocate. Even if you run this ship, which is very simple, the contact control is uncomfortable. First, they are not ergonomic. The system is extremely cumbersome, especially for the L1/LR and R1/R2 keys. You are on the Dualshock 4 summit so that you control you with your index finger and the middle finger. However, if you use remote controls of games, simply hover through D-PA and are essentially useless in combination with other keys. It is bad enough on the iPhone where the smaller screen makes everything easier, but try to play on the iPad remote and it is much worse. Solution? External driver. Since you cannot use DualShock 4, this is the best answer. I tested the remote maintenance with Steelseries Nimbus and I will tell you that it gives a much better impression. It's not without mistakes, but it works quite well. Nimbus is mostly firm. But because it does not offer the same buttons as Dualshock 4, it is sometimes strange. For example, use L3+R3 to switch to God of War on Spartan anger, but it doesn't workReally. It's probably the lack of L3/R3 button in the touch controls, so Sony didn't just map in the UI. Very interesting. This is an important part of some games, but not possible in the case of a remote game. T no, should I let the Spartan rage? Likewise, Nimbus doesn't have any options, share or PlayStation buttons which can be a bit odd. Although the Mid -meu button in Nimbus is not a direct backup for button sharing on PS, it repeats the behavior of the option button. Fortunately, both are placed in the touch pattern, so you can easily use them. And since these buttons are not used in a real game, it is not strange to use them in this way. If you can skip control issues, far play in iOS is pretty drastic. The quality of the stream depends on both the home network (PS4 location) and the network you're currently using, but if both are fast enough, you can get a very solid gaming session from anywhere... use of L3 keys does not require again and/or R3. But realistically, if you have the ability to play remotely in another device such as Android, Mac or Windows, this is only a better choice, as the local service has the 4th experience of DualShock. Experience is just a better result. Conclusion.
