Image Gallery: Documents To Go for Google Android devices There is no native Office viewer in the Android OS, but DataViz stepped up to the plate with a fully functional Word and Excel suite in Documents To Go. There are some features in this powerful suite that rival that found in desktop clients and not seen before in mobile clients. You can create, edit, and view Word and Excel files, including Office 2007 formatted files, with Documents To Go for Google Android devices Image Gallery: D Android devices Image Gallery: Documents To Go for Google Android devices To Go for Google Android devices Image Gallery: Documents To Go for Google Gallery: Documents To Go for Google Android devices Image Gallery: Documen devices Image Gallery: Documents To Go for Google Android devices Image Ga Google Android devices Image Gallery: Documents To Go for Google Android d Documents To Go for Google Android devices (Image credit: Tom's Guide) An image of an idyllic lake is wreaking havoc on Android phones, causing some to get caught in crash cycles and become 'soft-bricked.' This is effectively forcing users to reset their smartphones. The issue was flagged by leaker Ice Universe (opens in new tab), who noted that a simple image could cause some Android phone is caught in the display on and off if the image is set as a wallpaper. Once in this loop, there's no way to get out of it, even if the phone is caught in the crashing loop, the only way to get out of this soft-bricked status is to reset the handset, which could cause a lot of data loss for some people who don't back their phones up to cloud services. Not every phone is affected. OnePlus and Huawei handsets are seemingly immune, but Samsung Galaxy phones seem particularly prone to the crash-causing image. WARNING!!! Never set this picture as wallpaper, especially for Samsung mobile phone users! It will cause your phone to crash! Don't try it! If someone sends you this picture, please ignore it. pic.twitter.com/rVbozJdhkLMay 31, 2020See morelt's not clear exactly what is causing this image to crash Android phones. But Ice Universe reckons it's something to do with how the color space on the image is configured and how that color profile reacts with the Skia graphics engine Android uses. Effectively, metadata behind the image could be causing problems with Android uses. Effectively, which then seemed to prevent the image from crashing a phone when used as a wallpaper. 9to5Google (opens in new tab) did some more digging and noted that the problem is down to the color space Android wants to display. When I tried to upload the original image (left) to Weibo, I found that its color to change (right). At this time, the image became harmless, but when uploaded to twitter, the original image still does not change color, still harmful. So I suspect it may be related to color space, but the image uses the RGB color space which Android 10 doesn't play nice with. In Android 11 (opens in new tab), the color space is converted to sRGB so such crashes aren't an issue, meaning if you have a Pixel 4 XL (opens in new tab) you should be pretty safe from the problem. There's no word on where the image came from, with people avoiding posting links to it so as to curtail the spread of the damaging image. But suffice to say, if you see the image or you get sent it by someone, we very much suggest you avoid it. If you have already fallen foul to the image issue, then you'll need to factory reset your phone to get rid of it. Today's best Google Pixel 4 XL deals (opens in new tab) (open in new tab)View (opens in new tab) (opens in new ta anywhere. What's text recognition? It's technically known as optical character recognition (OCR) and can be really useful when you've got a paper document first, but then once you have that image you can run it through an OCR application that will read each character and attempt to recreate the original document as text. In most cases it will never be perfect, but with a high-quality scan you can come pretty close. This is even possible on your phone, and that's why we're looking at text recognition apps. Google Goggles Platform: Android Price: Free Download PageFeatures Converts images of text to actual textCan send that text to your clipboard for pasting just about anywhereCan translate resulting text into tons of different languagesCan recognize business cards and add them to your phone as contacts with one tapWhere It ExcelsGoogle Docs isn't necessarily the ideal OCR app, but it does everything it promises, and it does it well. Take a picture of any text and Google Goggles will turn it into copyable text you can then paste anywhere in your phone—a document editor, your note-taking app, Gmail, SMS, or anything else you could imagine. It can also recognize business cards, which is a killer feature—after scanning the card just one tap will add that person to your Google Contacts. It can also translate that text into a ton of different languages, which is great. Where It Falls ShortGoogle Goggles' main downfall is that it doesn't actually create a text file for you—it relies on you to do that yourself, go paste it in a document editor, and then save that somewhere on your SD card. This does make the process a little longer, but as of right now, there aren't really any true OCR apps that can do this either, so Google Goggles wins just by being an otherwise fantastic app. The Competition Surprisingly, there aren't a lot of OCR apps available for Android. Our second favorite app was ScanDoc Document Reader, which is a good scanner that can funnel text into many of the apps on your phone with one click. However, many of the apps failed to work for us—sending text to Gmail or SMS worked fine, but choosing Flick Note, Dropbox, and Google Docs all failed, kind of defeating the purpose of the "send to any app" feature. And for \$6 we feel like an app should actually do what it says it does. Plus, the interface is one of the ugliest we've seen in awhile. But if Google Docs. It's the only OCR app we used that actually recognized line breaks, which was a breath of fresh air, though since it's part of Google Docs and not an OCR-specific app, it wasn't quite as versatile as the above options, which give you more say in where that text goes. If you use Google Docs to scan stuff, you best believe it's going to go into Google Docs, and if you want it elsewhere, you'll have to copy and paste it yourself (and then delete that document). Still, the recognition was the best of all the other apps, so it might be worth it. Android does have good document scanning apps, but none of them are true OCR. Instead of turning that image into editable text, most of them turn it into a PDF document, which isn't exactly what we're looking for in this category. However, if that's all you need, CamScanner is pretty awesome, letting you scan any image, create multiple image documents, turn them into a PDF, and send them to one of many services like Dropbox or Google Docs. Document Scanner is similar, and lets you use the OCR capabilities of Google Docs and Evernote, but isn't quite as fast as Goggles' one-click copy if you wanted to save it in something else. Lifehacker's App Directory is a new and growing directory of recommendations for the best applications and tools in a number of given categories.
