Description: Perform an assignor http request (AJAX). A string containing the URL to which the request is sent. A set of key / value pairs that configure the AJAX request. All settings are optional. A pattern can be set for any option with \$.AJAXSETUP (). See JQuery.AJAX (configurations) below for a complete list of all settings. A set of key / value pairs that configure the AJAX request. All settings are optional. A pattern can be set for any option with \$.AJAXSETUP (). Accepts (pattern: depends on the datatype) a set of key / value pairs that maps a certain data data to your MIME type, which is sent in the header accept request. This header tells the server what type of response will accept in return. For example, the following defines a custom type mycustomtype to be sent with the request: Mycustomtype: 'application / x-something-type-type' 'text Mycustomtype': Function (result) {Note: You will need to specify a complementary entry for this type of converters for this to work correctly. By pattern, all requests are sent in a asunconal way (i.e. this is defined as true by pattern). If you need Soncronous Requests, set this option to false. Domain Requests Cross-Domain and Datatype: "JSONP" Requests do not support the Soncrona operation. Note that the Soncronous Requests may temporarily block the browser, disabling any actions while the request is active. From the JQuery 1.8, the use of assignment: false with jqxhr (\$.defred) is discounted; You must use the return returns for the return return / error / complete instead of the corresponding Methods of the JQXHR object, such as jqxhr.done (). Type: Function (JQXHR JQXHR, PlateObject Settings) A Callback Return Function -Solicitation that can be used to modify the JQXHR object (in JQuery 1.4.x . XmlHttpPrequest) before being sent. Use this to set custom headings, etc. JQXHR objects and settings are passed à € à €
