Ian Morris because the western regulation - for now it did this. Great historians have brought us whole ages: Niall Ferguson's Empire is an extraordinary result. Eric Hobsbawm trilogy, The Age of Revolution, The Age of Capital, and The Age of Empire is - despite Marxist bases - simply unsurpassed. Others wrote as futurists: The future shock of Alvin Toffler was revolutionary when it was published in 1970. More recently, George Friedman has written to entertain the next 100 years, Jacques Attali produced the controversial short story of the future, and L 'former director of The Economist, Bill Emmott, wrote a much more academic study, Rivals - as the power struggle between China, India and Japan is formed our next decade. When it comes to pure fiction, a more interesting "What if" novel, a sort of back-to-the-scenario future for adults, has been recently written by an Australian: David Kowalski The Society of the Dead is a take Entertaining how our world would appear if the United States had not intervened in the Great War. Similarly, of Brisbane very own John Birmingham brought us all in an exciting "What if" travel to a future not too far away with its two more recent books, without notice and after America. In because the Western rules, Ian Morris is committed to the novelists (Arthur C. Clarke, Jrr Tolkien and Leo Tolstoy are but three) and with the popular culture of our time (Star Trek is nothing), but the key For the charm of this book he lies in his attempt to provide what Niall Ferguson says is "the most close to a theory of the unified field of history we ever probably be able to get." And it's true. Because the West Rule is so much about that they are about where we come from. "Where we could go" It is left to the final, part III, of the book. In addition to being the shortest section of the book, it is also the weakest. While saving notions of predetermined historical development, Morris seems to agree that trends and models cannot be observed only, but he also repeated. So: "The West-to-East passage will certainly be faster than any in the previous story, but the old western core currently has a huge advantage in producing captured energy, technology and military capacity, and will almost certainly maintain His domain in some form through the first half of this century. Until the United States is strong enough to act as Globocop, great wars should be rare as they were when Great Britain was Globocop in the 19th century ". No word about the ethical or moral advantage granted by democracy and the rule of law, it is also the temptation to ask why 1966 classic social origins of the dictatorship of Barrington Moore and democracy is so obviously ignored. Above all, the incapacity to recognize that the global economic change already in progress - forget China for a moment and think of India and Brazil - it is a great gap like the refusal to grant that the United States has already reached a phase in which It is no more as possible A dependence on foreign capital to finance its position in the world. It is in a similar vein that by Paul Kennedy 1987 masterpiece ascent and decline of the great powers and the guard of him by the dangers of "excessive imperial ambition" is also overlooked. However, when Ian Morris is not just better than him, but where where where In his most unique and almost fascinating, it is in his framed of the question "because the Western rules" and in his efforts to provide a set of answers and explanations onnicompresions. "Ask why Western rules really mean to ask two questions", writes Morris. "We need to know why the West is more developed - that is, more capable of doing things - of any other region of the world, and because western development has increased so high in the last 200 years than for the first Once in history a few countries could dominate the entire planet. "He stronger - and fascinating - when writing the pre-story, the Neanderthals and the rise of the first human society, Morris does not apologize for its basic explanation that" The Western Government [was not] nor predetermined thousands of years ago nor the result of recent accidents. "" There had been unpacking in the past in the past, but their reach had always been regional. In 1842, however, producers. British could induce China with their products, British industrialists could build ironing ships that have reserved the world, and British politicians could send a meter expedition. "Then, what happened? The farewell to the west of plants and animals about 2000 years before the East is crucial for Morris as the concept and practicality of geography. Whereas the geographical insulation of Western Europe 5000 years ago came as the company was developing more quickly in Egypt and Mesopotamia, the same isolation - "blocked from Europe in the Atlantic" - later became a huge advantage as soon as The new types of vessels that could have the crossed oceans emerged. Thus, racial theories on Western supremacy are fired as absurdity. Similarly, long-term block theories - the West have always had its advantages in terms of climate, geography or resources - are considered inadequate as those short-term opinions that emphasize the primacy of being the first to industrialism. People, Morris demonstrates, they are really the same everywhere. And there are, crucially, exceptions at every stage of development. The author, perhaps somehow selfishly, uses what calls the Morris's theorem: "Change is caused by lazy, greedy and frightened people looking for easier, more profitable, and more confident to do things. And they rarely know what they are doing. "What it means is obvious: when the pressure is turned on, the change takes off. It explains a lot, from our transition to cultivation and irrigation as well as mass migrations and new inventions and the massive jump to plant cereals to build steam motors. Religion is also offered in terms of materialistic explanation, subject to a kind of science of history governed by law. While the ancients have invented the worship to understand the world that surrounds them, the emergence of new religions was a sign, says Morris, who "people were asking for salvation from this problematic world, not the rational explanation for this". It is important to underline that Western rules never assumes a linear course in history. Rather, Morris explains, the development and innovation course does not run smoothly. "Innovation means changing, bring joy and pain to the equal measures. Social development creates winners and losers ... its growth depends on the companies that become larger, more complicated and more difficult to manage; higher increases, plus threats to SA © create. So the paradox: social development creates much forces that minive it. "This does not mean that Morris is a kind of intelligent economic or social determinist: there is a wide range of knowledge from a wide range of schools of thought. No one is rejected in their entirety; All are data credits as part of a larger whole. Even the theory of man History - I.E. The unique genes, not large impersonal forces, form events - is given its due. Similarly, the other side of the coin of great man is the theory of the story of the bungling-idiot. What does Morris asked, would have succeeded, Has Success Have the Basiliskos had the wits don't get trapped against the coast? Archeology, Anthropology, Biology, Biology, history, geography, geology ... make no mistake: at more than 600 pages, this is not a light read. What is, though, it is a fascinating theory of who we are, where we come from and just where we might be heading.
