Requirements: Only for Windows 95 version 4.00.950b and 4.00.950c. iTunes on Windows is terrible. Launch it, and everything comes to yelling still as iTunes consumes all your resources to do the most basic things: play music. Not only that, but year after year, it seems that the iTunes interface gets worse and worse, confusing even the most savvy of computer users. Whatever your reasons for hating Apple's music player, you're in luck. Windows has more amazing music programs than you can shake a stick, many of which are still more powerful than iTunes. Here are some of our favorites. MusicBee: The DO-Everything Player! for most people MusicBee is the Jack of all operations in the music world of Windows. He does a lot of things, and he does them all for free. Other players can excel more in some areas, but MusicBee aims to please everyone. Think of MusicBee as a version and lighter than Winamp, without a lot of cruft. It has a familiar interface for converted iTunes, but you can move things around and customize the window to your liking, adding extra supplies for texts, now playing, Bios artists and more. It also has a very active skinning community, which means you Make it look rather sparkling without a lot of work. It also supports some Winamp plugins, so you don't have to give up those super-personalized functions you have come to rely. It can synchronize music on Android phones and other non-iOS devices, and convert tracks to the fly if they are not compatible with your reader. This has a native support for Groove music and Last.fm, can be cared by taking his library, tear cd, and also appease audiophiles that require Wasapi support. Also Afly rather fast, at least for small and medium-sized libraries, and Afly updated quite frequently despite being a one-man operation. Its forums and wiki are also great resources, and the developer is very active in helping people with problems. If you feel overwhelmed by all the Windows options, it's difficult to make mistakes with MusicBee. Try and you won't be disappointed. MediaMonkey: Perfect for iOS users and Super Large libraries despite the review referred to above, actually not use musicBee. I use our second favorite choice, MediaMonkey, which is probably more than a real iTunes replacement. Why? Because MediaMonkey is one of the only musical players able to synchronize music on iOS devices, including iPhone and iPad. (You still need iTunes installed, but you will never have to open it - MediaMonkey just need drivers provided with it.) In addition to synchronization, MediaMonkey excels in organizing the devil out of large, Unwieldy libraries. It can be a little more slow than MusicBee for normal libraries, due to the database style you use, but if your library is enormous, excels when other players fail. Its tagging capabilities are second to none, allowing you to automatically tag your music or carefully fill metadata with its robust tag editor. It allows you to move between the elements dell interface to customize the way you want, and also has several skin (even if the skinning community is not active as once). It also supports add-ons for extra functionality. MediaMonkey has one major drawback: some of its more advanced features (such as smart playlists, automatic organization, or on-the-fly conversion during synchronization) require a license to pagamento. A Golda MediaMonkey is \$ 25 for the current version or \$ 50 for a lifetime version. Some people may not need these features, but if you do, pay them can be annoying, especially since it offers many free © MusicBee. But if you need to sync with iOS, cá is no way around: MediaMonkey is your replacement for iTunes. foobar2000: Customize your music player from scratch You are a fan of customization? MusicBee and MediaMonkey are not configurable enough for you? If you really want to edit any pixels of your music player interface, welcome to your new paradise: foobar2000. foobar2000 is not for the faint of heart. When you start it for the first time, you are provided with an extremely simple and lightweight interface (like the one shown above). And maybe that's just what you do. Foobar2000 really excels when you start customizing it. You have complete freedom to create the appearance of the player as you like with skin, different organization of the panel and so on. You can include features such as auto-tagging or ripping the cd as "agent features ... during installation and Foobar2000 has plugins for anything you can imagine. Basically, you're building your custom player from (almost) nothing. Don't believe me? Look around the internet for people's threads showing their Foobar2000 configuration. You see countless screenshots that don't even look like the same player. This is the amount of customization offers Foobar2000. You just need to be willing to put in the work. Aside from that, Foobar2000 is also popular with audiophiles for its Plethora of playback options and advanced plug-ins. If you are really, really serious about your music, Foobar2000 is an open sandbox to play with. Tomahawk: Combine streaming and social in one program If you can't decide between your local music library and streaming services, Tomahawk does a decent job of combining them all. Supports streaming services such as "YouTube, Spotify, Rhapsody, Tidal, Amazon Music, OwnCloud, Subsonic, Jamendo, and Bandcamp. It can also connect more social tools like Jabber and Hatchet, more music graphics like billboards, iTunes, metacritic and more. (Note that for some of these services, such as Spotify, you will need a premium account to access them from Tomahawk.) In short: Tomahawk aims to combine the many, many music sources out there into a single program, with a social Turkish. You can create your own custom stations, listen to what your friends are playing, release and share songs and have songs shared with you. It may be a bit slow to search for so many services at once, but they probably don't slow down as launching a lot of different apps to search for their individual catalogs. If you've started moving past the local mp3 libraries and into the new millennium ... but still want everything in one place ... Tomahawk could be for you. There are more iTunes alternatives than we could ever go through an article - AIMP, Clementine, Windows Media Player, VLC, and even the winamt There are M-Not-Dead-Ey-Winamt are still solid choices for many. You could spend days looking for your favorite replacement. But we think the choices above are good places to start ... they are, by far, the best we have used. Used.
